TRANSITIONAL_WRITES

What about the application of the Solomonoff induction to the RF sensing of human brain?

https://en.wikipedia.org/wiki/Talk:Solomonoff%27s_theory_of_inductive_inference

1. If we assume that the algorithmic complexity of neural processes is relatively small (you could take a look at the Potapov monography for some arguments)
2. As far as I know a lot of neural processes in human brain are electric (or electro-chemistry) in nature. They have a little power and a small frequency (~ 1-1000 Hz). So they emit very low frequency radio waves.
3. You can detect those radio waves on small antennas if the impedance of such antennas is matched. This is basically the citation from the book on electrodynamics. I uploaded one such book on Twirpix site.
4. So you can create a lot of such receivers
 - microstrip filter to filter very high frequencies
 - impedance matched microstrip antenna
 - resistor for noise for oversampling
 - very fast comparator to sample signal
 in a very large array on a chip using standard CMOS or some sort of full-custom process (maybe even with some new materials)
5. BeamForming and large arrays of digital correlators with sub-mm positioning accuracy could be achived.

so it seems there is no theoretical obstacles to implement some sort of RF human brain sensing or even control if you can implement reverse structure with array of a large amount of RF amplifiers with sub-mm beam forming accuracy

BTW I wrote that remark:

https://en.wikipedia.org/wiki/Talk:Solomonoff%27s_theory_of_inductive_inference

What about the application of the Solomonoff induction to the person to person information exchange?

It seems the minimum description length principle could be used to deduce minimum ethics. At least you can compare ethics by the length. What about the following question: how to shoot met-art girl in the dark underground? ~2026-24709-41 (talk) 16:43, 8 June 2026 (UTC)

at least we can ask a question: does russian met-art model from a pic want some money? and what obstacles do that guess so hard? why it is so hard to contact her directly? she lose money, interesting person lose opportunity to make some photos.

also, it seems the economy without coordination primitives based on physics or mathematics like gold or maybe Bitcoin or maybe some sort of other physical objects or processes is just a chaos. Economic calculation based on fiat money is impossible just from scientific methodology https://en.wikipedia.org/wiki/Talk:Solomonoff%27s_theory_of_inductive_inference

It seems it is proof of the famous <https://mises.org/online-book/economic-calculation-socialist-commonwealth>

Kirill Abramovich
Samara, Russia

and the most important question:
what about the minimal ethics deduced from the MDL principle?
is it exist?

what was the obstacle between russian met-art girls and engineers?
